

Title Proposal Evaluation Form

SECTION:	STEM 12-Y1-3P	DATE EVALUATED:	
GROUP NO.:	GROUP 3	LEADER'S LASTNAME:	DE GUZMAN, ERICA
PROPOSED TITLE:			
A Comprehensive Note-Taking Application: AI-Supported Voice Isolation, Accurate Tag-lish Recording, and Offline–Online Accessibility			

SCORING GUIDE:

Score Description

- 5 Excellent – Fully meets and exceeds expectations
- 4 Very Good – Meets expectations with minor issues
- 3 Satisfactory – Meets minimum requirements
- 2 Needs Improvement – Partially meets criteria
- 1 Poor – Does not meet expectations at a

EVALUATION CRITERIA AND DESCRIPTORS:

Criteria	5 – Excellent	4 – Very Good	3 – Satisfactory	2 – Needs Improvement	1 – Poor
1. Clarity of Title	The title is very clear, precise, and free from jargon.	Generally clear with minor wording issues.	Understandable but may contain some awkward phrasing.	Somewhat unclear; needs rewording.	Confusing and lacks clarity.
2. Relevance to Field	Highly relevant to the strand and current issues.	Relevant, with minor stretch to the field.	Somewhat relevant but needs better alignment.	Marginally related; may be off-topic.	Irrelevant or disconnected from field.
3. Specificity of Topic	Very focused, specific, and well-defined.	Focused but can still be refined.	Adequately specific but slightly broad.	Too broad or too narrow.	Vague or overly general.
4. Feasibility	Realistic given time/resources; doable in a school setting.	Mostly realistic with minor constraints.	Some concerns with time/resources.	Significant feasibility concerns.	Unrealistic or unachievable.
5. Researchability	Clearly researchable; measurable variables/questions.	Generally researchable; minor concerns.	Somewhat researchable but vague.	Weak research potential.	Not researchable.
6.Originality/ Innovation	Highly original; creative and new.	Somewhat original; adds value.	Common topic with slight twist.	Overused idea with minimal originality.	Cliché or plagiarized concept.

Total Score: _____ / 30
(Passing Score Suggestion: 18/30 or higher)

Evaluator’s Feedback / Suggestions for Revision: _____

Background of the Study: (3–5 sentences explaining the issue or situation)

Note-taking remains as a necessary practice for both students and professionals, yet customary handwritten and digital methods often fail in the environments that are fast-paced, noisy, or multilingual such as in the Philippines where “Taglish” is widely used (Escaño, 2023; Sindatok, 2025). Artificial Intelligence recent advances have improved speech recognition and noise suppression, and this enables the systems in order to isolate voices and to produce transcriptions more accurate in challenging conditions (Nogales, Caracuel-Cayuela, & García-Tejedor, 2024; Jafarzadeh Asl et al., 2025). AI can also assist in organizing notes as well as in summarizing notes, offering efficiency through manual processes. Users greatly need offline features where connectivity is limited, so notes can still be stored, edited, and recorded. Online access enables AI-powered enhancements, cloud storage, and exporting to formats such as PDF or DOCX. Given these needs, a comprehensive note-taking application that combines AI-supported voice isolation, Taglish transcription accuracy, organized storage, and offline–online accessibility can provide a more inclusive and practical solution for everyday use.

Recent advancements in Artificial Intelligence (AI) have made it possible to enhance transcription accuracy through voice isolation and noise suppression, allowing clearer recognition even in crowded or noisy surroundings (Nogales, Caracuel-Cayuela, & García-Tejedor, 2024). AI also supports efficient note organization, summarization, and storage, enabling users to focus more on learning and productivity rather than manual processes (JMIR Formative Research, 2021). Furthermore, the demand for offline functionality has increased in areas with limited or unstable internet access, while online features such as cloud storage, exporting, and file sharing remain equally important (Notta.ai, 2024; MeetJamie.ai, 2024).

Despite these developments, most transcription tools remain limited in scope. Many are designed primarily for English or single-language contexts and lack optimization for bilingual environments like the Philippines (Malaay, Millan, & Cabatuan, 2024; Sibayan, 2023). Others perform poorly in terms of usability, clarity, and adaptability under real-world conditions. As a result, there is a need for a comprehensive note-taking application that combines AI-supported voice isolation, accurate Taglish transcription, organized storage, and both offline and online accessibility. Such an application can provide a practical and inclusive solution that addresses the linguistic diversity, technological limitations, and productivity needs of Filipino students and professionals.

Statement of the Problem:

General Problem:

Efficient note-taking is essential for knowledge retention and comprehension. When notes are disorganized, they can hinder understanding and lead to a failure to grasp key information. Other already existing applications offer note-taking applications but they don't take in mind voice isolation that can help an accurate note taking, the possibility of Taglish users and offline and online access. Therefore, developing an application to address this widespread issue is crucial for supporting individuals in their academic and professional pursuits.

Specific Questions (3):

1. How effective is the voice-to-text application in converting spoken words in real time?
2. How much does the gadget help students stay more focused during class discussions compared to usual note-taking methods?
3. How well does the device help students who find taking notes by hand is difficult or exhausting?

Objectives:

General Objective:

The main focus of this research is to provide a solution to the inadequate capturing, organizing, and retrieval of recorded information.

Specific objectives:

- Attain optimal note-taking accuracy through AI voice isolation and recognition technology.
- Facilitate note retrieval through a simplified user interface that works both online and offline.
- Create a robust storage system that correctly and securely organizes notes, ensuring long-term accessibility.
- Capture conversations, lectures, and meetings with ease, along with the ability to record spontaneous Taglish (tagalog and english) conversations.
- Provide note organization by assigning customizable tags, categories, and keywords that are searchable.
- Include a search function for easy access to particular notes and recordings.
- Embed an AI voice generator for added accessibility to recorded notes.
- Improve academic, occupational, and personal efficiency by reducing time spent on note-taking.

Variables:

- **Independent Variables** - the research's independent variables are the features we added in/when creating the application, feature such as: Ai-supported feature for voice isolation, Taglish voice recording, Organized notes, and availability to online and offline users are the things we improved to see how these features influence the user.
- **Dependent Variables** - The dependent variable in our study measures the effectiveness of the note-taking application among the users. It calculates the user satisfaction with the features; retention of lessons, improved study capability, and overall learning support provided by the application.

Scope and Delimitation: (What is included and excluded in the study?)

This quantitative study will focus on the development and evaluation of a Voice-to-Text application that aims to enhance accessibility and efficiency in note-taking and transcription. The application will feature voice isolation for clearer output, offline and online accessibility, and bilingual compatibility in Tagalog and English. It will also be assessed in terms of accuracy in speech-to-text conversion, as well as its ability to provide organized storage, easy file navigation, and direct note recording. In addition, the application will integrate AI assistance to improve user experience by supporting navigation and productivity.

This study is limited to the development and evaluation of a voice-to-text note-taking application with features such as AI-supported voice isolation, offline and online use, Tagalog–English compatibility, organized storage, and easy navigation. It does not include other languages, advanced AI functions (like handwriting recognition or predictive text), or long-term user adoption. The evaluation is confined only to the app's accuracy, clarity, accessibility, and usability within the stated features.
